Data storage device

Abstract
(JP05173893)

PURPOSE: To display secret data even if a pass word is forgotten, for example, by displaying stored data when it is detected that data which is the same as input data is being stored.

CONSTITUTION: CPU 4 detects the operating signal of a key in a key part 5, writes and reads data in RAM 6 and displays read data in a display part 7, etc. When the registered pass word is forgotten, the S1 key for switching an operation mode in the key part 5 is operated at first so as to make a state for waiting the input of the pass word, the S2 key for releasing the pass word is operated and, after that, secret data which a user remembers is inputted. When the data coincides with designated data, the pass word is displayed in the display part 7 and data in the first page of a secret data sorting part is displayed. In this way, data of the succeeding page is successively displayed whenever the operated S3 key is operated when succeeding data is read.
